Download Release As the value and use of information continues to increase, individuals and businesses seek additional ways to process and store information. One option available to users are information handling systems. An information handling system generally processes, compiles, stores, and/or communicates information or data for business, personal, or other purposes thereby allowing users to take advantage of the value of the information. Because technology and information handling needs and requirements vary between different users or applications, information handling systems may vary with respect to the type of information handled; the methods for handling the information; the methods for processing, storing or communicating the information; the amount of information processed, stored, or communicated; and the speed and efficiency with which the information is processed, stored, or communicated. The variations in information handling systems allow for information handling systems to be general or configured for a specific user or specific use such as financial transaction processing, airline reservations, enterprise data storage, or global communications. In addition, information handling systems may include or comprise a variety of hardware and software components that may be configured to process, store, and communicate information and may include one or more computer systems, data storage systems, and networking systems. Information handling systems may be coupled to a server which may be a dedicated appliance that is solely employed to store large volumes of data. Alternatively, the server may be a shared resource on an information handling system that may be used to store data for multiple information handling systems. The capacity of the server may be based on the amount of data stored on the system, the speed of the system, the overall storage requirements of the information handling systems coupled to the server, and/or other factors. In order to manage the storage of data on the server, the server may be partitioned into one or more volumes. A volume may be a group of storage devices on which data is stored. As the amount of data stored on the server grows, the use of volumes may become a bottleneck in the storage of data on the server. Thus, there is a need for improved methods and systems for storing data on a server. Texas A&M celebrated Thanksgiving by beating North Carolina 38-7 and by taking freshman quarterback Kyle Murray, who passed for over 300 yards and five touchdowns. The sophomore has played well this season, but it's been overshadowed by the incredible performance by his predecessor, Kevin Sumlin. At halftime, the red-clad Aggies were up 17-0 on the Tar Heels and made it look easy. It's only 82157476af
